Issue	GitHub URL	Title	Summary Report
#739	https://github.com/aiondemand/AIOD-rest-api/issues/739	Replace traceback.print_exc() with logging.exception() for structured logging	Issue: Production error handlers used traceback.print_exc(), which writes directly to stderr and bypasses containerized log shippers like Logstash and Grafana. Solution: Replaced raw console prints with structured logging.exception() calls across core exception handlers via PR #740.
#737	https://github.com/aiondemand/AIOD-rest-api/issues/737	Deprecation of datetime.utcnow() and improvement of synchronization logic	Issue: The codebase uses legacy, timezone-naive datetime methods and lacks standard error logging. Solution: Datetime methods were modernized to Python 3.12+ standards and synchronization logic was improved via PR #738.
#712	https://github.com/aiondemand/AIOD-rest-api/issues/712	[Bug]: Error in initial setup of repository	Issue: The initial setup script fails due to missing modules, mismatched signatures, and invalid example data references. Solution: Missing modules were added, signatures aligned, and JSON files sanitized to ensure proper database population via PR #716.
#652	https://github.com/aiondemand/AIOD-rest-api/issues/652	Deleting an asset doesn't remove its submission	Issue: Deleting an asset before a review is finished leaves a ghost review request. Solution: Blocked deletion of assets pending review via PR #695, returning a 403 Forbidden error requiring prior retraction.
#648	https://github.com/aiondemand/AIOD-rest-api/issues/648	Collation out of sync	Issue: Identifier columns lacked explicit collation, causing database inconsistency where fresh databases used case-insensitive defaults while migrations enforced case-sensitive utf8_bin. Solution: Standardized all identifier columns with a shared IDENTIFIER_TYPE forcing utf8mb3_bin collation on MySQL.
#636	https://github.com/aiondemand/AIOD-rest-api/issues/636	Relationship Deletion Bug - Data Integrity Issue	Issue: A two-stage deletion process fails to remove relationships, causing ghost entries and orphaned data. Solution: Updated the serializer layer via PR #646 to filter out soft-deleted assets automatically from response relationships.
#622	https://github.com/aiondemand/AIOD-rest-api/issues/622	Missing the content-type header fails silently	Issue: The API silently fails and returns a 200 OK status when the Content-Type header is missing, ignoring updates. Solution: Implemented a global validation middleware via PR #735 to enforce Content-Type headers on write requests, returning a 415 Unsupported Media Type response when missing or invalid.
#553	https://github.com/aiondemand/AIOD-rest-api/issues/553	Deleting an asset is very slow	Issue: Deleting assets took several seconds because orphan deletion triggers performed expensive full-table scans across many-to-many relationship tables. Solution: Optimized resource deletion via PR #697 by refactoring triggers into targeted link-table checks and adding indexes to link columns.
#485	https://github.com/aiondemand/AIOD-rest-api/issues/485	Provide more information in error log	Issue: Error logs for asset uploads lacked useful content, displaying placeholder text like body: '<Data Stream content unknown with>' instead of the payload. Solution: Implemented request body capture for validation and HTTP exceptions via PR #724, making the actual uploaded asset data visible in error logs for easier debugging.
#442	https://github.com/aiondemand/AIOD-rest-api/issues/442	Concurrent requests may lead to errors	Issue: Concurrent asset uploads failed with duplicate entry errors when attempting to insert the same non-existent term simultaneously. Solution: Resolved race conditions by wrapping term insertions in savepoints, utilizing locking reads to safely reuse concurrently committed terms, and enforcing a fixed insertion order to prevent deadlocks.
#224	https://github.com/aiondemand/AIOD-rest-api/issues/224	Docker compose permission error	Issue: The short-lived es_logstash_setup container threw Permission denied errors when attempting to write configuration files due to host-to-container user mapping discrepancies. Solution: Configured an explicit container user in the Docker Compose setup via PR #713, resolving the permission failure out-of-the-box without requiring manual host-level chmod/chown workarounds.
#633	https://github.com/aiondemand/AIOD-rest-api/issues/633	Versioning subresource schemas	Issue: API versioning transformations leak into nested resources, returning them in the latest schema instead of the requested version. Solution: Implemented a version-aware serialization framework via PR #678 to thread the requested API version context throughout the entire serialization chain for nested relationships.
#733	https://github.com/aiondemand/AIOD-rest-api/issues/733	docs: Add professional README.md with comprehensive setup instructions	Issue: The repository lacked a professional README and setup instructions for new contributors. Solution: Added a comprehensive README.md to streamline onboarding, which will continue to be iteratively updated as development progresses.
#563	https://github.com/aiondemand/AIOD-rest-api/issues/563	Update documentation of`contact_details`	Issue: Documentation still referenced the deprecated and removed contact_details field on Person and Organisation objects, causing confusion for users. Solution: Updated the REST API docs, upload guides, and migration pathways via PR #723 to explicitly document the transition to the generic contacts mapping at the AIResource level.
#663	https://github.com/aiondemand/AIOD-rest-api/issues/663	Rate limit the request of reviews	Issue: The platform lacked controls to protect the manual review pipeline from being congested by users spamming asset submission requests. Solution: Implemented configurable per-user rate limiting for review submissions via PR #711, adding adjustable time windows and roll limits.
#661	https://github.com/aiondemand/AIOD-rest-api/issues/661	Rate limit the uploading of assets	Issue: The platform lacked safeguards to prevent users from flooding the database with raw draft files by spamming asset uploads. Solution: Implemented configurable, user-scoped rate limiting for asset uploads via PR #680, enforcing rolling-window limits that return a 429 Too Many Requests status.
#654	https://github.com/aiondemand/AIOD-rest-api/issues/654	Pagination and Sorting for user resources	Issue: Fetching multi-table assets caused results to lose database sequence, leading to quirky pagination and sorting. Solution: Implemented an entry_order mapping strategy via PR #676 to lock in the proper database sort sequence throughout the entire query lifecycle, removing the need for Python-level re-sorting.
#525	https://github.com/aiondemand/AIOD-rest-api/issues/525	Include Deserialized Assets in the submission endpoint	Issue: The submission endpoint returned raw database references or identifiers instead of fully expanded objects, requiring clients to make multiple API roundtrips to retrieve nested details like keywords and application areas. Solution: Applied the orm_to_read deserialization pattern via PR #727 to ensure the GET /submissions/{identifier} endpoint returns fully deserialized assets with complete nested relationships and improved OpenAPI schema documentation.
#518	https://github.com/aiondemand/AIOD-rest-api/issues/518	Reinstate Check Constraints for Contact	Issue: The Contact model lost its database-level check constraint ensuring mutual exclusivity between person and organisation references due to a known MariaDB engine limitation with cascade updates. Solution: Implemented application-level validation via PR #714 to safely enforce mutual exclusivity, returning a clear 400 Bad Request when both fields are provided while re-enabling regression tests.
#488	https://github.com/aiondemand/AIOD-rest-api/issues/488	Do not share entire connector directory for each connector	Issue: Connectors mounted the entire shared ${DATA_PATH}/connectors directory instead of isolated subdirectories, creating a risk of cross-contamination between connectors. Solution: Closed the issue without changes, as connectors are not currently used.
#456	https://github.com/aiondemand/AIOD-rest-api/issues/456	Zenodo dataset not found	Issue: A specific Zenodo dataset (zenodo.org:14276654) failed to import via the Zenodo connector and returned a 404 Not Found error. Solution: Closed the issue without changes, as connectors are not currently used.
#455	https://github.com/aiondemand/AIOD-rest-api/issues/455	Rename containers	Issue: Docker container names were too generic, causing naming collisions and confusion when running multiple projects concurrently on a local machine. Solution: Updated the Docker Compose configurations to use clear, project-specific prefixes for better namespace isolation.
#308	https://github.com/aiondemand/AIOD-rest-api/issues/308	Update Platform Validation Endpoint	Issue: Platform validation relied on a hardcoded Python Enum, potentially blocking retrieval from newly added platforms. Solution: Closed the issue without changes, as there are currently no plans to add new platforms to the system.
#292	https://github.com/aiondemand/AIOD-rest-api/issues/292	Don't allow empty ("") enums	Issue: The API incorrectly allowed empty strings ("") to be stored in string-based enum tables, polluting the database with invalid values. Solution: Implemented validation via PR #744 to silently reject or ignore empty enum strings during ingestion.
